

VOICE RECOGNITION WITH ZEDBOARD

MOD002726

CONTENTS

1. Introduction
2. Alternatives
3. CMUSphinx
4. Application
5. Conclusions
6. References

I. INTRODUCTION

- ***Deliverable***: Demo of a household controlled by voice using the microphone-line of the Zedboard.
- A client of Alexa Voice Service (AVS) is available for the Raspberry Pi.
 - ***AlexaPi*** [2] may run on the Zedboard as well (Debian)
 - However, it simply sends and receives voice from the cloud.
 - Voice recognition is used only to trigger the interaction (keyword “alexa”)

2. ALTERNATIVES

1. Cloud Computing: Voice recognition to trigger AlexaPi (desktop mode) and an Amazon **skill** that connects back to a local script (i.e, relay controller).
2. Local Processing: Alternative way to trigger AlexaPi (platform dependant) and “hack” the voice recognition to create a separated **listener**.

Option 2: The listener application will be based on the module used in AlexaPi for voice recognition: CMUSphinx [3]

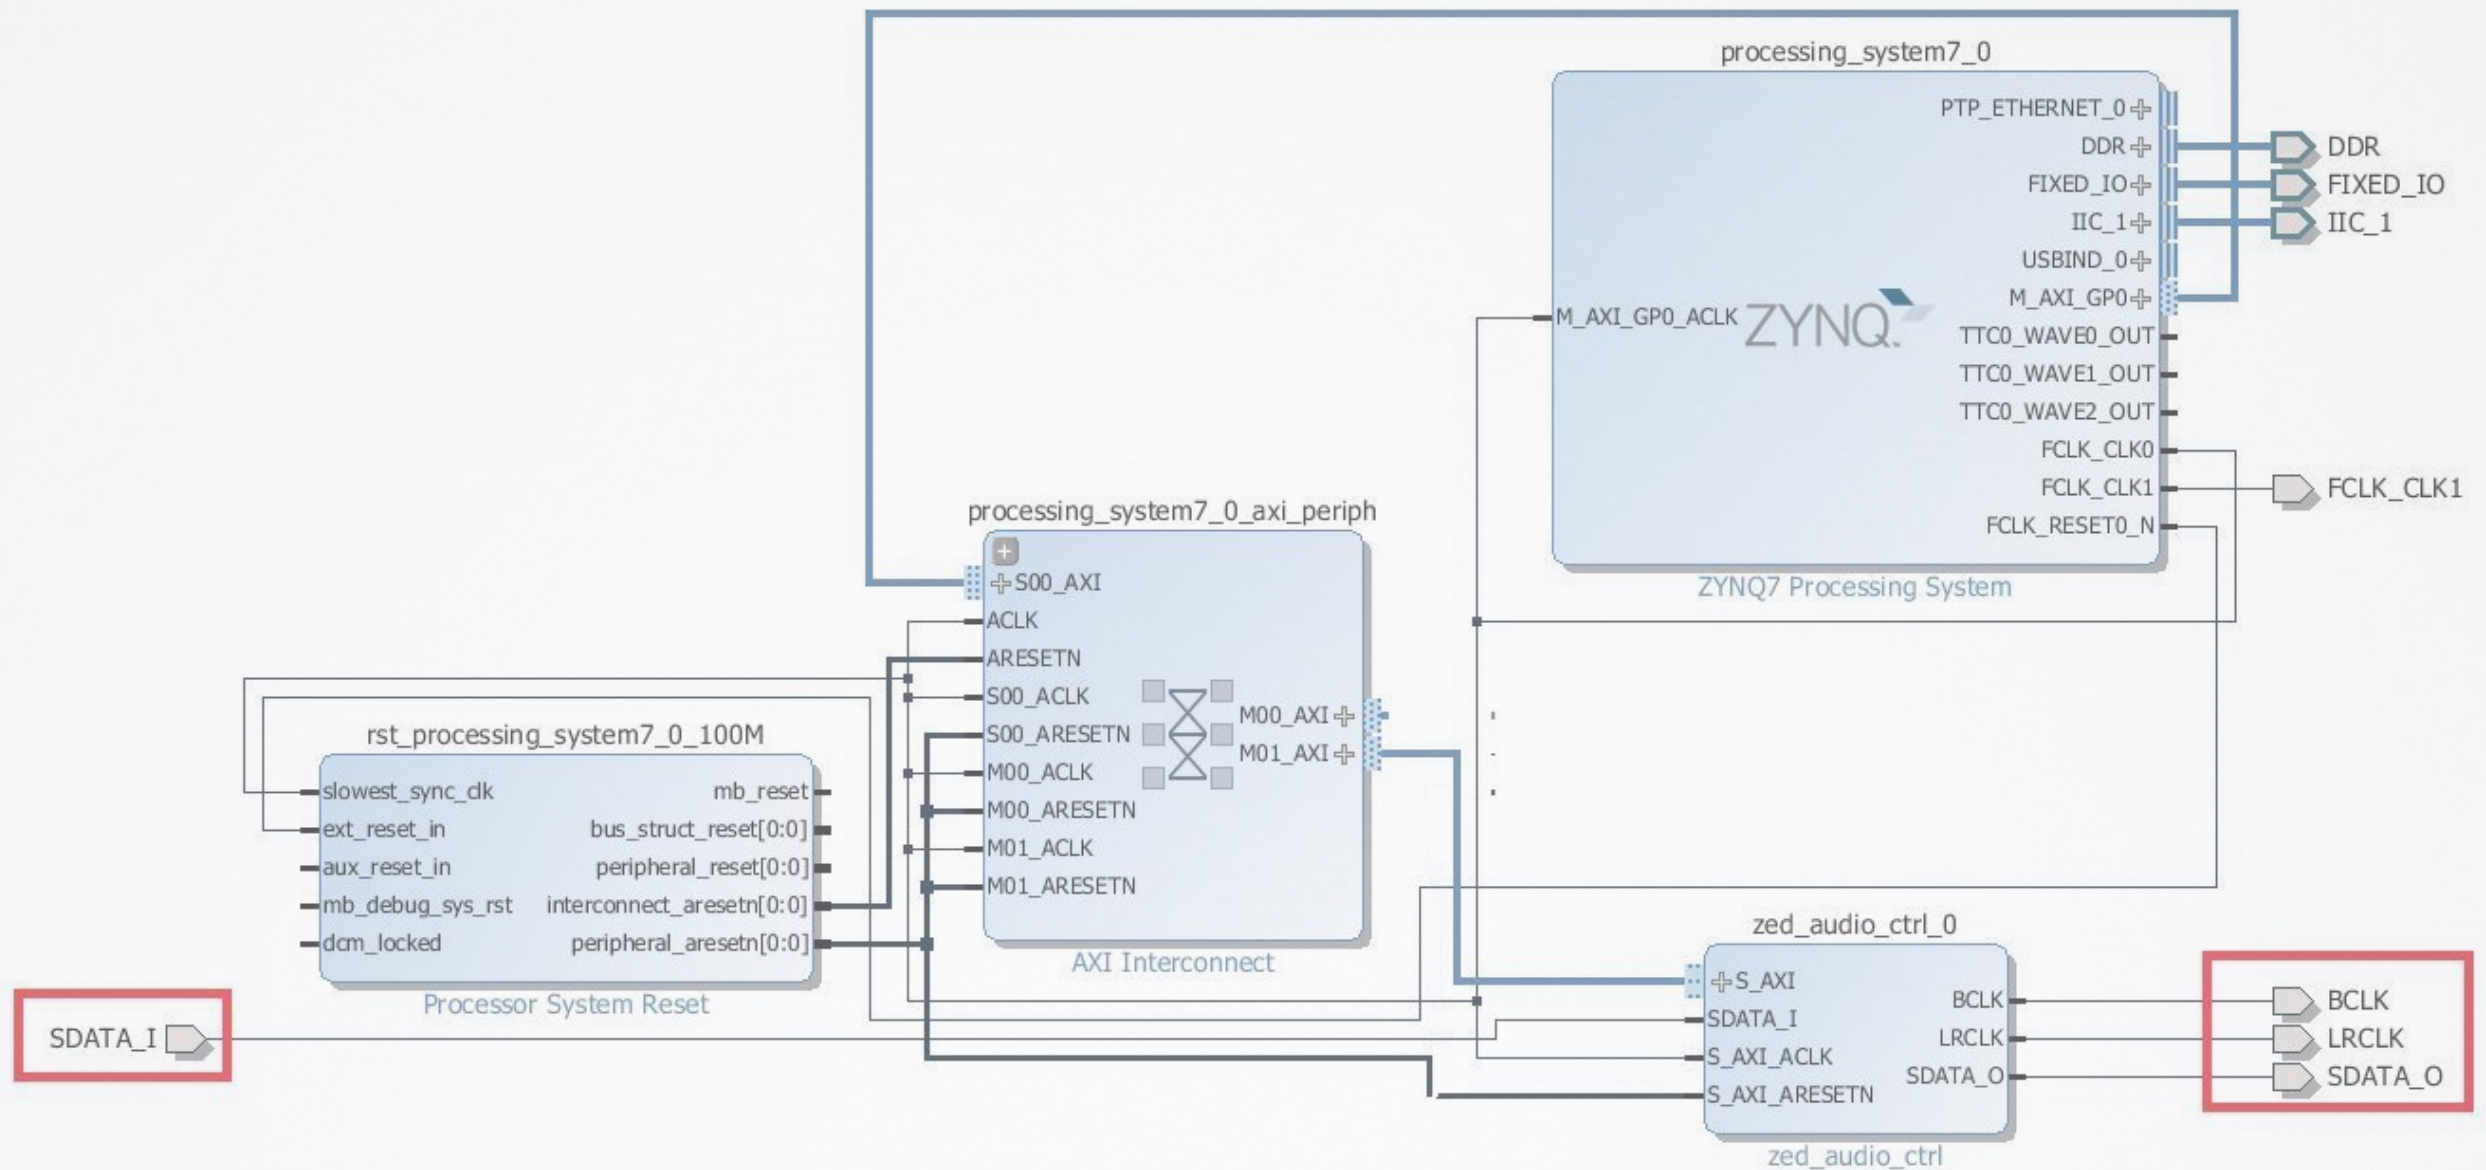

3. CMUSPHINX

- Open-source **Speech To Text** library (STT) from Carnegie Mellon University (CMU) with an optimised version for ARM processors (PocketSphinx).
- How to use it in Zynq devices? (see chapter 5 - PS/PL tools):
 - *like a **bare-metal** application (Vivado / SDK)*

An IP core implements a I2S link for sending samples to the audio codec. The samples are transferred between the PS part and the audio codec via the AXI bus. Then a SDK project should be created to process the samples by the processor [1].
 - *like a process inside of **Xilinx**®*

All the logic to interface the audio codec is integrated in a single IP core [5]. The OS allows multiple applications at the same time, video interface, memory management, ...

VIVADO/SDK

Source [1]

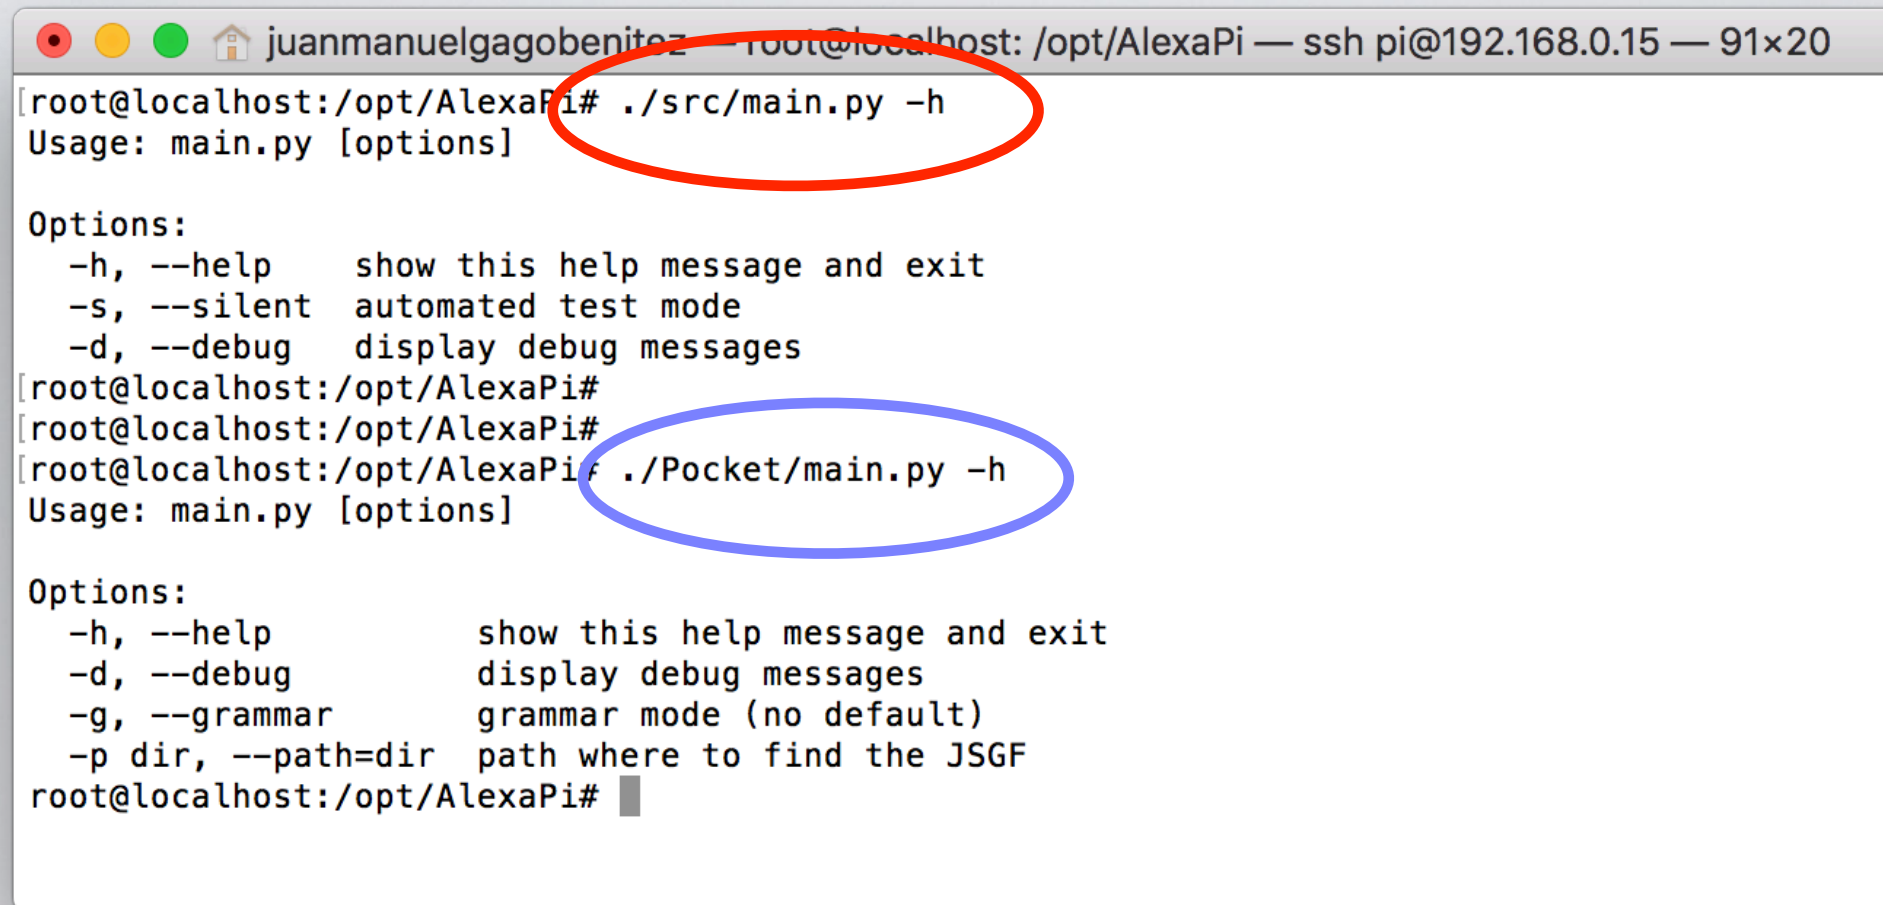

XILLINUX®

- The Xillinux® bundle includes the Xillybus® core (PL part) and the Linux image with the drivers (PS part).
 - It is based on Ubuntu 16.04 so it's open-source and Python is already installed.
 - Supports sound by interfacing dedicated Xillybus® streams with the **Pulseaudio** framework [4]
- Btw, AlexaPi is written in Python and uses the Pulseaudio framework [2]
- This option doesn't require to have much experience with Vivado

CONTENTS

1. Objective: *“Household controlled by voice”*
2. Amazon skill (cloud) or *using the AlexaPi voice-recognition*
3. CMUSphinx: bare-metal app or *Xilinx® process*
4. **Application** and test results
5. Conclusions
6. References

4. APPLICATION

```

juanmanuelgagobenitez root@localhost: /opt/AlexaPi — ssh pi@192.168.0.15 — 91x20
[root@localhost:/opt/AlexaPi# ./src/main.py -h
Usage: main.py [options]

Options:
  -h, --help      show this help message and exit
  -s, --silent    automated test mode
  -d, --debug     display debug messages
[root@localhost:/opt/AlexaPi#
[root@localhost:/opt/AlexaPi#
[root@localhost:/opt/AlexaPi# ./Pocket/main.py -h
Usage: main.py [options]

Options:
  -h, --help          show this help message and exit
  -d, --debug         display debug messages
  -g, --grammar       grammar mode (no default)
  -p dir, --path=dir  path where to find the JSGF
root@localhost:/opt/AlexaPi#
```

Two Python scripts: **AlexaPi** (modified) and **Pocket** (new design)

Modes: secret(trigger), grammar (turn on the lamp) or keyword (alexa)

AUTOMATED TEST

Raspberry Pi configuration:

1. Keyword detection: audio generation with TTS module (***Text To Speech***)
2. Grammar recognition: monitoring led status (GPIO4 input)
3. AlexaPi on Zedboard: button simulation (GPIO4 output)

TEST RESULTS

Test Case	Input	Expected	Output	Result
1 Pocket - keyword detection	10 random commands starting with “alexa”	10 detections	10 detections	Pass
2 Pocket - grammar recognition	20 turn on and off commands	20 led switching	20 led switching	Pass
3 AlexaPi - autotest mode	10 random commands starting with “alexa”	10 answers from AVS	8 answers, 2 unknown	Fail

5. CONCLUSIONS

- AlexaPi customised to use the leds and push-buttons on the Zedboard [2]
- Methodology with ope-source components:

PS	PocketSphinx [3] and Pulseaudio [4]
PL	Xillybus® integrated in the Xillinux® bundle [5]

5. CONCLUSIONS

- A listener application has been developed with PocketSphinx [3]
- Grammar mode to control a GPIO in the PL part: led or a relay to switch on a household (see deliverable)
- Voice recognition using cloud computing vs local processing

Cloud	Two failures in AlexaPi
Local	No failures with Pocket
